AB Isolated and purified platelet **voltage dependent calcium channel** (VDCC) α 1 subunit polypeptides, and **nucleic acid** molecules encoding the same. Recombinant host cells, recombinant nucleic acids, and recombinant proteins are also disclosed, along with methods of producing each. Isolated and purified antibodies to platelet VDCC α 1 subunit polypeptides, and methods of producing the same, are also disclosed. Platelet VDCC α 1 subunit polypeptides have biological activity in calcium transport. Thus, therapeutic and diagnostic methods involving

this activity are also disclosed.

AB Isolated and purified platelet **voltage-dependent calcium channel** (VDCC), $\alpha 1$ subunit polypeptides, and **nucleic acid** mols. encoding the same are provided. RT-PCR was used to amplify, clone, and sequence flanking regions of VDCC $\alpha 1$ subunit cDNA from cultured human megakaryocytes and from fresh porcine platelets. Two different isoforms are expressed on human megakaryocytes; one exhibits sequence identity to the L-type VDCC $\alpha 1$ subunit sequence from human skeletal muscle $\alpha 1S$ and the other exhibits sequence identity to the human neuro-endocrine cells $\alpha 1D$ sequence. The platelet $\alpha 1$ subunit is localized in a tight membranous network of the open canalicular system. Recombinant host cells, recombinant nucleic acids and recombinant proteins are also disclosed, along with methods of producing each. Isolated and purified antibodies to platelet VDCC $\alpha 1$ subunit polypeptides have biol. activity in calcium transport. Thus, therapeutic and diagnostic methods involving this activity are also disclosed.

AB Affinity-purified, polyclonal antibodies to the γ subunit of the dihydropyridine (DHP)-sensitive, **voltage-dependent calcium channel** have been used to isolate complementary DNAs to the rabbit skeletal muscle protein from an expression library. The deduced primary. . . domains and two N-linked glycosylation sites, consistent with biochemical analyses showing that the γ subunit is a glycosylated hydrophobic protein. **Nucleic acid** hybridization studies indicate that there is a 1200-nucleotide transcript in skeletal muscle but not in brain or heart. The γ . . .

LANGUAGE: English
SUMMARY LANGUAGE: English

AB Complementary DNAs were isolated and used to deduce the primary structures of the $\alpha 1$ and $\alpha 2$ subunits of the dihydropyridine-sensitive, **voltage-dependent calcium channel** from rabbit skeletal muscle. The $\alpha 1$ subunit, which contains putative binding sites for calcium antagonists, is a hydrophobic protein with. . . other voltage-dependent ion channels. In contrast, the $\alpha 2$ subunit is a hydrophilic protein without homology to other known protein sequences. **Nucleic acid** hybridization studies suggest that the $\alpha 1$ and $\alpha 2$ subunit mRNAs are expressed differentially in a tissue-specific manner and that there. . .

AB . . . neutrophils. Once produced these species can produce injury and permanent damage to a number of cell components such as lipids, **nucleic acids** and proteins to produce their toxic effects. Tissue derived superoxide generation can be prevented by the use of xanthine oxidase. . . there is considerable evidence that reperfusion injury to various organs can be reduced or prevented simply by the administration of **voltage dependent calcium channel** blocking agents. The ability to improve neurological outcome after stroke with the calcium channel antagonist nimodipine is an exciting development. . .
